

Zepto E-commerce Inventory SQL Analysis Project

Project Objective

The objective of this project is to analyze real-world Zepto inventory data using SQL to uncover pricing insights, stock issues, discount effectiveness, and category-wise performance. This mirrors real data analyst tasks such as data cleaning, exploratory analysis, and deriving actionable business insights.

Business Problem

Zepto manages thousands of products across categories, each with variable pricing, discounting, and stock levels. The business needs clarity on inventory availability, revenue potential, category performance, and discount strategy to improve profitability and customer experience.

Sample Business Questions Solved

1. Top 10 best-value products based on discount percentage. 2. Products with high MRP but out of stock. 3. Estimated revenue calculation for each category. 4. Products where MRP > 500 and discount < 10%. 5. Top 5 categories offering the highest average discount. 6. Price per gram for products above 100g, sorted by value. 7. Categorization of products into Low, Medium, and Bulk groups. 8. Total inventory weight per category.

Insights

- Several categories show consistently high discounts, highlighting promotional strategy opportunities.
- High-MRP out-of-stock items indicate missed revenue potential.
- Weight-based analysis shows which categories carry the most inventory load.
- Category-wise revenue potential reveals the most profitable segments.
- Discount and pricing patterns help identify best-value products for customers.

Final Conclusion

The analysis reveals strong patterns in pricing, stock availability, and category performance. Optimizing inventory for high-MRP out-of-stock items and refining discount strategies can significantly boost revenue and customer satisfaction. These insights offer a clear roadmap for smarter, data-driven e-commerce decisions.

About This Project

This project is created as part of a Data Analytics portfolio to demonstrate SQL skills in a real e-commerce environment. It showcases practical tasks such as database creation, cleaning, and deriving business insights.
